

NATURE'S OWN ENERGY SUPPORT

ENADA contains the substance NADH (Nicotinamide Adenine Dinucleotide). Recent studies have supported that NADH can support the memory, cognitive capability, the immune system, and DNA repair for production of cellular energy. NADH is a

natural substance that increases energy and occurs in every living cell: plants, animals and humans. When cells slow down or decline the most visible result is tiredness or fatigue. Inside each cell is a process known as the 'krebs cycle', this combines NADH with Hydrogen to form ATP, your own body's energy, acting like a biological battery that stores and releases energy when the body needs it. **For more information call 01262 607890.**
